

mDNS Services

Skaarhoj panel use mDNS to announce themselves on the network to make panel discovery easy for users. There are some network structures that can make it desired for this to be disabled.

To disable this service add **disablemdns** into the log string in the System Manager package on the packages page.

The screenshot shows the Skaarhoj System Manager interface. The top navigation bar includes 'System', 'Home', 'Configuration', 'Simulator', 'Packages', and 'Settings'. The 'Device' is identified as 'Heather's BP'. The main content area shows the 'system-manager' package (Version: 1.0.8) with a status of 'Running'. A red arrow points to the 'Confirm' button. The log output shows various system messages, including 'MDNS disabled module=pkg/discovery'. A red box highlights the 'disablemdns' command in the 'Log String' input field, with a 'Save' button next to it. Below the input field, there is a 'Clear' button and a red text prompt 'Enter command and save'.
