

# UniSketch Panel Displaying Weird in Simulator Tab

If your UniSketch panel is displaying weird in the Simulator tab, it may be due to old firmware on the UniSketch panel.

For compatibility with Blue Pill, a UniSketch panel needs to be running UniSketch v2.5.14 or later. Starting with UniSketch v2.5.18, there were changes made to the Raw Panel implementation which is used to connect to the Blue Pill. These changes allow for better hardware mapping inside Blue Pill.

Please make sure your UniSketch panel is running the latest UniSketch release version using the Firmware Updater Application.
